Summary

Ecos is cross-platform framework for running co-simulations adhering to the Functional Mock-up Interface (FMI) standard (Blochwitz et al., 2012); an open standard for model exchange and co-simulation of dynamic systems. An FMU (Functional Mock-up Unit) is a self-contained component that implements the FMI standard. It is packaged as a zip archive containing:

- A shared library for each supported platform, which implements a standardized C interface.
- A *modelDescription.xml* file, describing the FMU's capabilities and available variables.
- Optionally, component-specific resources embedded within the archive.

The intention of Ecos is to provide a streamlined way of working with such FMUs, and supports version 1.0, 2.0 and 3.0 of the standard with respect to co-simulation. In particular, support for FMI 3.0(Junghanns et al., 2021) is still limited in many tools, and Ecos aims to help bridge this gap. Ecos also supports the System Structure & Parameterization (SSP) standard(Köhler et al., 2016), which can be used to import systems of FMUs in a structured and tool-agnostic way. Ecos consists of a Command Line Interface (CLI), as well as a C++ library, *libecos*, with interfaces provided in C and Python. The Python package is available through the pypy package index as *ecospy*. The project is structured as a mono-repo with a major goal of being simple to build. This also implies few and light-weight dependencies.

Some features available with Ecos:

- Support for SSP 1.0.
- Support for FMI 1.0, 2.0 & 3.0 for Co-simulation.
- Built-in plotting capabilities with inline and XML configuration options.
- CSV writer with inline and XML configuration options.
- Scenarios - actions to run at specific events.
- Remoting - allowing models to interact across processes.

DRAFT

The Journal of Open Source Software

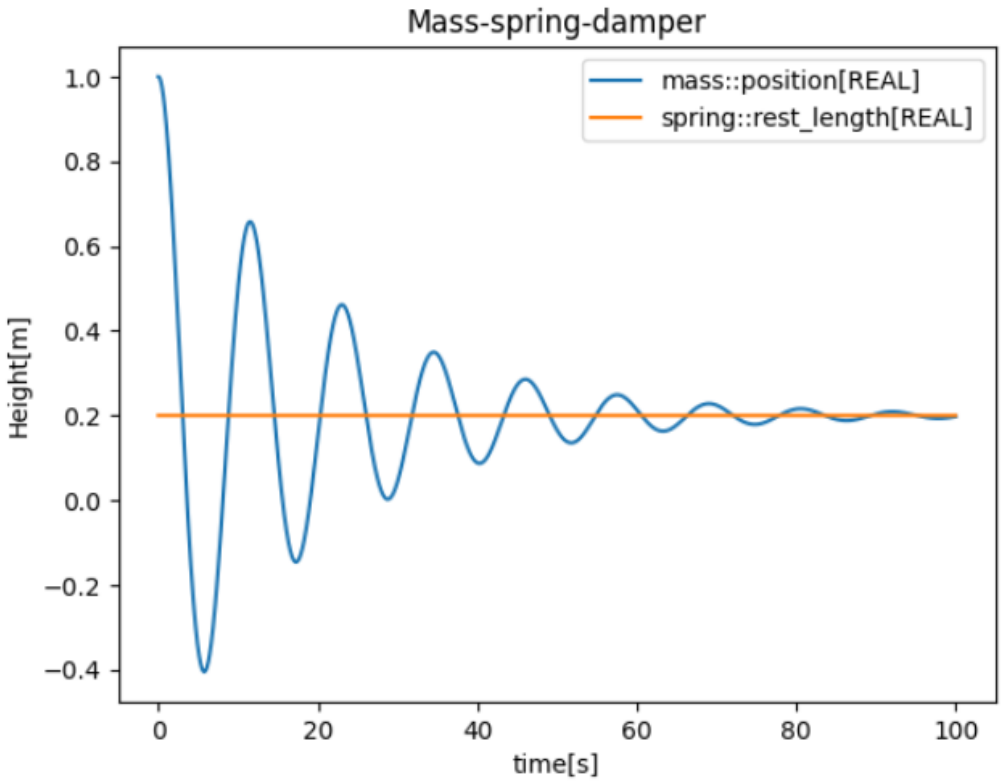

Figure 1: Ecos provides post-simulation plotting facilities.

Figure 1 demonstrates a simulation of a simple *mass-spring-damper* system with Ecos. The models are packaged following the SSP standard and subsequently simulated and plotted with *libecos*.

Statement of need

While similar tooling exists like FMPy(CATIA Systems, 2017), Vico(Hatledal et al., 2021), Open Simulation Platform (OSP) (Smogeli et al., 2020) and OMSimulator(Ochel et al., 2019), Ecos aims to deliver a higher level of flexibility, extensibility and accessibility through an easy to build and consume package. In particular, Ecos acts as a successor to the JVM based Vico framework.

Table 1 compares Ecos with some of the other available tools. While seemingly similar, Ecos niche is to provide an intuitive low-level C++ API, simple yet powerful Python, C and CLI interfaces, as well as support for all three versions of FMI for Co-simulation and built-in means of distributing simulation components across processes, while also keeping build dependencies to a minimum.

Table 1: Comparison of tools.

Feature	FMPy	OMSimulator	OSP	Ecos
Language	Python	C, Lua, Python	C++, C, Python	C++, C, Python
FMI Support	FMI 1.0, 2.0, 3.0 (ME, CS)	FMI 2.0, 3.0 (ME, CS)	FMI 1.0, 2.0 CS	FMI 1.0, 2.0, 3.0 CS

Feature	FMPy	OMSimulator	OSP	Ecos
Co-simulation	Yes	Yes	Yes	Yes
Model Exchange	Yes	Yes	No	No
GUI	Basic (Individual models)	Yes (OMEdit)	No	No
CLI	Yes	No	Yes	Yes
License	BSD	OSMC-PL	MPL	MIT

The software is currently being used to support the EU project TWINVEST, where NTNU is a partner.

Future of Ecos

Ecos currently ships with a capable, but simple *fixed_step* orchestration algorithm. The API is designed to be extensible and the goal is to include more advanced orchestration algorithms. However, pursuing this should be driven by a clear user need.
