## <sup>9</sup> Summary

<sup>10</sup> Planets are complicated. Understanding how they work requires connecting individual objects to the context of broader populations. Exoplanets are easier to picture next to their closest <sup>11</sup> Solar System archetypes, and planets in the Solar System are richer when seen alongside a growing community of known exoplanets in the Milky Way. The exoatlas toolkit provides <sup>12</sup> a friendly Python interface for retrieving and working with populations of planets, aiming to <sup>13</sup> simplify the process of placing worlds in context.

## <sup>16</sup> Statement of need

<sup>17</sup> exoatlas was designed to meet a need among both researchers and educators for an intuitive <sup>18</sup> Python tool to access planet populations. Particularly in working with students and junior <sup>19</sup> scientists, for whom easy avenues for exploration and play would have particular benefit, <sup>20</sup> significant barriers often frustrate attempts to perform the following tasks:

- retrieving basic properties for exoplanets + Solar System objects
- calculating derived planet quantities with propagated uncertainties
- comparing individual exoplanets to relevant comparison samples
- planning future telescope observations of known exoplanet systems
- making beautiful and up-to-date planet data visualizations

<sup>21</sup> Online planetary data archives merge incredible curatorial efforts with powerful tools for data <sup>22</sup> access and visualization, including the NASA Exoplanet Archive ([Christiansen et al., 2025](#)), <sup>23</sup> exoplanet.eu ([exoplanet.eu, 2025](#)), exo.MAST ([STScI, 2025](#)), TEPCat ([Southworth, 2011](#)), <sup>24</sup> Open Exoplanet Catalog ([Rein, 2012](#)) for exoplanets and the JPL Solar System Dynamics <sup>25</sup> ([JPL, 2025](#)), IAU Minor Planet Center ([IAU, 2025](#)), the NSSDCA Planetary Facts sheets <sup>26</sup> ([Williams, 2025](#)) for Solar System objects. exoatlas does not intend to replace any of these <sup>27</sup> important archival efforts (it pulls nearly all its data from them); rather, exoatlas aims to <sup>28</sup> provide an approachable interface for exploratory analysis and illuminating visualizations to <sup>29</sup> help the community make better use of these resources.

## <sup>35</sup> Mapping populations with exoatlas

<sup>36</sup> The user interface for exoatlas centers around the Python Population class, with each <sup>37</sup> Population object containing a standardized table of planet properties and methods for <sup>38</sup> interacting with that table. exoatlas makes extensive use of astropy ([Astropy Collaboration](#)

<sup>39</sup> et al., 2022) to be as familiar as possible for modern astronomers, and it is thoroughly  
<sup>40</sup> documented with astronomical audiences in mind at [zkbt.github.io/exoatlas/](https://zkbt.github.io/exoatlas/).

- <sup>41</sup> ▪ To retrieve planet data, exoatlas provides Population objects that automatically access  
<sup>42</sup> archive data for exoplanets as well as Solar System major planets, minor planets, and  
<sup>43</sup> moons. Exoplanet data come from the NASA Exoplanet Archive (Christiansen et al.,  
<sup>44</sup> 2025) API, and Solar System data come from the JPL Solar System Dynamics (JPL,  
<sup>45</sup> 2025) API or small reformatted data tables included in the package repository itself.  
<sup>46</sup> Whatever the original data source, all Population objects act similarly and have uniform  
<sup>47</sup> nomenclature for accessing data columns. Planet quantities all have physical units  
<sup>48</sup> attached with astropy.units to facilitate unit conversions and minimize conceptual  
<sup>49</sup> errors. New Population objects can also be created from astropy.table tables, enabling  
<sup>50</sup> custom datasets to be included.
- <sup>51</sup> ▪ To calculate derived quantities for planets, a set of default methods are included within  
<sup>52</sup> the core Population definition, or users may attach their own calculation methods. If  
<sup>53</sup> data for a quantity is missing, calculations can be used to swap in alternate estimates;  
<sup>54</sup> for example, a planet's semimajor axis  $a$  will attempt first to pull from the original  
<sup>55</sup> data table, and then second to calculate  $a$  from the planet's period  $P$  and the star's  
<sup>56</sup> mass  $M_*$  assuming Newton's Version of Kepler's Third Law  $P^2 = 4\pi^2 a^3/GM_*$ , and  
<sup>57</sup> then third to calculate from a transit-derived ratio  $a/R_*$ . Uncertainties on all derived  
<sup>58</sup> quantities can be numerically propagated using the astropy.uncertainty framework,  
<sup>59</sup> where distributions of samples are generated for each original table quantity, carried  
<sup>60</sup> through calculations, and then used to estimate confidence intervals.
- <sup>61</sup> ▪ To extract sets of planets meeting particular criteria, Population objects can be indexed,  
<sup>62</sup> sliced, and masked to generate new smaller Population objects. Coupling familiar  
<sup>63</sup> array or table operations into the creation of subpopulations enables nuanced filtering of  
<sup>64</sup> datasets based on any combination of original archival table quantities, derived quantities,  
<sup>65</sup> and/or quantity uncertainties.
- <sup>66</sup> ▪ To plan telescope observations of known exoplanet systems, exoatlas can estimate the  
<sup>67</sup> signal-to-noise (S/N) ratio achievable for exoplanet observables. As derived quantities, all  
<sup>68</sup> S/N estimates can include propagated uncertainties, to help avoid biasing target samples  
<sup>69</sup> toward systems with larger uncertainties. Using astroplan (Morris et al., 2018) and  
<sup>70</sup> astropy.coordinates (Astropy Collaboration et al., 2022), exoatlas can determine  
<sup>71</sup> local altitudes and azimuths for all elements in a Population, as well as upcoming  
<sup>72</sup> opportunities to observe transits from ground-based telescopes (when the star is above  
<sup>73</sup> the horizon, the Sun is down, and the planet is passing in front of the star). Including  
<sup>74</sup> basic observation planning tools enables a workflow where targets can be filtered both  
<sup>75</sup> by the estimated detectability of a signal and by whether a telescope can actually point  
<sup>76</sup> at the system.
- <sup>77</sup> ▪ To make explanatory illustrations of planet data, exoatlas includes a visual language to  
<sup>78</sup> build up population comparison plots. The core elements of this visual language are the  
<sup>79</sup> Plottable (a quantity that should be represented with certain scaling, limits, and labels),  
<sup>80</sup> the Map (a panel expressing plottable quantities with position, size, or color), and the  
<sup>81</sup> Gallery (a collection of maps with linked axes and/or datasets). Preset visualizations  
<sup>82</sup> built from this language can offer quick contextual reference for a planet's fundamental  
<sup>83</sup> properties, as in Figure Figure 1, which was generated with only six lines of code:

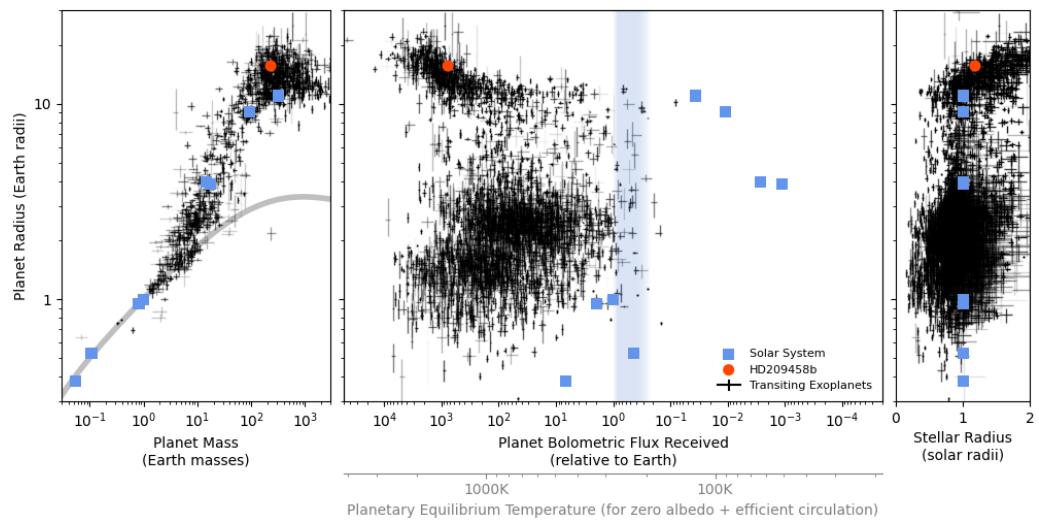

```

from exoatlas import *
from exoatlas.visualizations import *

e = TransitingExoplanets()
s = SolarSystem()
h = e["HD209458b"]

PlanetGallery().build([e, s, h])

```

**Figure 1:** Example exoatlas visualization placing the first discovered transiting exoplanet HD209458b in context with other transiting exoplanets and the eight major Solar System planets. Errorbars use a color intensity that scales inversely with quantity uncertainties, to avoid giving undue visual weight to the least precise data.

## 84 Research, teaching, and learning

85 exoatlas was designed to support the researcher who wants to contextualize planet populations  
 86 in papers, proposals, or talks, the educator who wants help connect lessons more immediately  
 87 to real exoplanet and Solar System data, and the student who simply wants to learn a little  
 88 more about oodles of neat planets. All these communities are encouraged try exoatlas, to  
 89 ask for help, to suggest improvements, and/or to contribute code!

## 90 Acknowledgements

91 We acknowledge the long commitment federally-funded archives have made to preserving and  
 92 sharing data with the scientific community, and the heroic efforts of the people who build,  
 93 maintain, and continually improve those archives. This material is based upon work supported  
 94 by the National Science Foundation under Grant No. 1945633.
