²² The region of space within the Sun's envelope of influence is called the heliosphere (the bubble²³ of solar influence extending beyond the planets). The field of heliophysics (the study of the²⁴ Sun and its influence throughout the solar system) starts in the solar interior and extends out²⁵ to the very local interstellar medium, just beyond the heliosphere. The solar wind is a stream²⁶ of charged particles that continuously flows away from the Sun, carrying mass, energy, and²⁷ momentum along with an embedded magnetic field. In short, it mediates the interaction of²⁸ the Sun with the heliosphere and this is a feature shared by stars and their astrospheres more broadly. Changes in the solar wind are one source of space weather, which is a critical threat to our technological infrastructure on Earth and in space. SolarWindPy provides a unified framework for analyzing the solar wind and related space weather data, filling the gap between packages targeting astronomy, remote observations of the Sun, and general timeseries analysis of spacecraft based data. The package is available via PyPI¹ and conda-forge² and can be installed using `pip install solarwindpy` or `conda install -c conda-forge solarwindpy`.

⁴ Summary

⁵ The region of space within the Sun's envelope of influence is called the heliosphere (the bubble⁶ of solar influence extending beyond the planets). The field of heliophysics (the study of the⁷ Sun and its influence throughout the solar system) starts in the solar interior and extends out⁸ to the very local interstellar medium, just beyond the heliosphere. The solar wind is a stream⁹ of charged particles that continuously flows away from the Sun, carrying mass, energy, and¹⁰ momentum along with an embedded magnetic field. In short, it mediates the interaction of¹¹ the Sun with the heliosphere and this is a feature shared by stars and their astrospheres more broadly. Changes in the solar wind are one source of space weather, which is a critical threat to our technological infrastructure on Earth and in space. SolarWindPy provides a unified framework for analyzing the solar wind and related space weather data, filling the gap between packages targeting astronomy, remote observations of the Sun, and general timeseries analysis of spacecraft based data. The package is available via PyPI¹ and conda-forge² and can be installed using `pip install solarwindpy` or `conda install -c conda-forge solarwindpy`.

¹⁸ Statement of Need

¹⁹ There is a growing ecosystem of python libraries to enable astrophysics, solar physics, plasma²⁰ physics, and space physics. The table below cites key examples. Notably, there are several²¹ packages that support different elements of space physics, including magnetospheric data²² analysis (Pysat), integration of magnetospheric observations (SpacePy), and the retrieval and²³ analysis of heliophysics timeseries data (pySpedas and PyTplot). Tools for the dedicated analysis²⁴ of solar wind observations are noticeably absent. SolarWindPy fills this gap by providing a²⁵ unified framework for analyzing solar wind observations in combination with relevant information²⁶ about the spacecraft from which the observations were made. The package targets heliophysics²⁷ researchers analyzing spacecraft observations, from graduate students learning plasma analysis²⁸ to experienced scientists conducting multi-mission data studies.

Library	Purpose	Citation
AstroPy	Astronomical observations.	(Astropy Collaboration et al., 2013, 2018, 2022)

PyTplot	Timeseries and spectrograph data visualization.	(Harter & MAVENSDC Team, 2019)

29 The SolarWindPy framework utilizes a pythonic, class-based architecture that combines ion
 30 and magnetic field objects into a single, unified plasma. It is designed for both experienced
 31 researchers and to provide an intuitive scaffold for students learning to analyze spacecraft data.
 32 SolarWindPy's primary functionality (core, fitfunctions, plotting, instabilities, and solar_activity
 33 submodules) was written by the author and developed or utilized in support of multiple
 34 publications (B. L. Alerman et al., 2018; Benjamin L. Alerman et al., 2021; B. L. Alerman,
 35 Rivera, Lepri, & Raines, 2025; B. L. Alerman, Rivera, Lepri, Raines, & D'Amicis, 2025; B. L.
 36 Alerman, 2025; B. L. Alerman & D'Amicis, 2025a; B. L. Alerman & D'Amicis, 2025b; B.
 37 L. Alerman & Kasper, 2019). The transformation from thesis research code to a production
 38 package deployable via PyPI and conda-forge was accomplished using AI-assisted development
 39 with specialized quality assurance infrastructure for the supporting infrastructure (test suites,
 40 documentation, and deployment workflows), while the core scientific functionality remains
 41 human-authored.

42 The package builds on NumPy (Harris et al., 2020; van der Walt et al., 2011), SciPy (Virtanen
 43 et al., 2020), Matplotlib (Hunter, 2007), and Pandas (McKinney, 2010, 2013; McKinney,
 44 2011) to ensure stable dependencies. The plotting module maintains timeseries-to-observation
 45 mappings for interactive data extraction and automatically maps plotted quantities to descriptive
 46 filenames for analysis traceability. Non-linear fitting libraries support multi-step nested regression
 47 workflows for parameter estimation. Submodules provide magnetohydrodynamic turbulence
 48 analysis and kinetic instability calculations. The solar_activity submodule provides seamless
 49 access to solar activity indicators from LISIRD (Leise et al., 2019) and SIDC (Vanlommel et
 50 al., 2005), enabling solar wind analysis across solar cycle phases. Data storage currently uses
 51 pandas DataFrames and Timeseries, with architecture supporting transitions to xarray (Hoyer
 52 & Hamman, 2017), SunPy, or AstroPy data structures.

53 Quality Assurance and AI-Assisted Development

54 SolarWindPy's evolution from thesis research code (B. L. Alerman et al., 2018; Benjamin L.
 55 Alerman, 2019; B. L. Alerman & Kasper, 2019) to a production software package required
 56 systematic quality assurance for comprehensive testing, documentation, and deployment infra-
 57 structure. To be explicit about the scope of AI assistance: the core scientific modules (core/,
 58 fitfunctions/, plotting/, instabilities/, solar_activity/) containing the physics algo-
 59 rithms and analysis methods were developed by the author without AI assistance and represent
 60 the scholarly contribution of this work, validated through eight peer-reviewed publications (B.
 61 L. Alerman et al., 2018; Benjamin L. Alerman et al., 2021; B. L. Alerman, Rivera, Lepri,
 62 & Raines, 2025; B. L. Alerman, Rivera, Lepri, Raines, & D'Amicis, 2025; B. L. Alerman,
 63 2025; B. L. Alerman & D'Amicis, 2025a; B. L. Alerman & D'Amicis, 2025b; B. L. Alerman
 64 & Kasper, 2019). AI-assisted development was used exclusively for supporting infrastructure:
 65 test suites, continuous integration pipelines, package deployment workflows, and completion of
 66 docstring documentation.

67 The quality assurance methodology utilizes Claude Code (Anthropic, 2024) with domain-specific
 68 validation infrastructure designed for scientific computing correctness. This approach maintains
 69 clear boundaries between deterministic and agentic tasks by combining specialized agents
 70 and pre-commit hooks to ensure correctness, while the scientific algorithms remain entirely
 71 human-authored as evidenced by their multi-year publication history. This systematic validation
 72 enabled development of comprehensive test suites (targeting 95% coverage, with core physics

73 modules achieving 95% and overall coverage at 78%), completion of documentation including
74 missing docstrings, and creation of continuous integration and deployment pipelines for PyPI,
75 conda-forge, and ReadTheDocs.

76 The complete infrastructure, including agent specifications, pre-commit hooks, and workflow
77 automation, is publicly available in the .claude/ directory of the repository, establishing a
78 reproducible framework for quality assurance in AI-assisted scientific software development.

79 Acknowledgements

80 The author thanks L. Woodham and R. D'Amicis for discussions about Alfvénic turbulence
81 and calculating the Elsasser variables. In line with the transition to AI-augmented software
82 development, Claude code ([Anthropic, 2024](#)) was used in writing this paper.
