Summary

⁵ Bluesky Social is an offshoot of Twitter, designed to provide a decentralized alternative to traditional social media platforms. bskyr is an R package ([R Core Team, 2025](#)) that provides programmatic access to Bluesky Social. The package wraps the official Bluesky Social API, enabling users to retrieve posts, threads, user profiles, social graphs (e.g., follows, mutes, blocks), curated lists, and starter packs. It also supports content creation and interaction so that users can post, reply, like, repost, and follow directly from R. All data is returned in tidy data frames, making it compatible with standard R workflows for analysis and visualization. This allows users of bskyr to not only collect data for observational studies but also to engage with the platform programmatically, such as posting updates or interacting with other users.

Statement of Need

¹⁵ Following the acquisition of Twitter by Elon Musk in 2022, Bluesky Social launched a public beta in February 2023. Bluesky Social is built on the Authenticated Transfer (AT) Protocol, a decentralized social networking protocol that emphasizes user control, data portability, and interoperability. Bluesky has over 30 million users ([The Bluesky Team, 2025](#)). A similar package, Rroot ([Schoch & Chan, 2023](#)), has been designed for an alternative decentralized platform Mastodon.

²¹ Bluesky's decentralized design makes it an appealing platform for researchers interested in social media data, as it allows for near complete access to public posts, user interactions, and social graphs without the restrictions often imposed by centralized platforms. In contrast, existing packages for Twitter, such as academictwitteR ([Barrie & Ho, 2021](#)) or rtweet ([Kearney, 2019](#)), have unfortunately become less reliable due to changes in Twitter's API access policies and the platform's evolving nature under new ownership.

²⁷ Due to the decentralized nature of Bluesky Social, users can access a wide range of public data without the restrictions often imposed by centralized platforms. This is unlikely to be threatened by future changes to the platform, as Bluesky Social is open-source and designed to be accessible, with final control held by a public benefit corporation.

³¹ bskyr offers a consistent and user-friendly interface to nearly all public endpoints of Bluesky Social. It handles authentication, pagination, and API structure internally, allowing users to focus on data retrieval and interaction logic rather than protocol details. By supporting both reading data from and writing data to Bluesky, bskyr enables reproducible workflows that cover data collection, analysis, and programmatic engagement with the platform. This makes it a valuable tool for researchers, developers, and analysts working with social data in R.

³⁷ Finally, bskyr offers flexibility in inputs and outputs. All core operations are supported with automatic tidying of data into familiar tidy formats from the tidyverse ([Wickham et al., 2019](#)). Users can opt out of cleaning returned data, allowing them to read in raw JSON as native R lists. Similarly, users can use bskyr to handle the uploads, but pass their own list objects.

⁴² Software design

⁴³ The package attempts to balance tidiness with a light touch to avoid blocking future features
⁴⁴ as they become supported by the upstream API. The core goals of Bluesky and downstream
⁴⁵ clients differ greatly. Bluesky's overall service and underlying data are designed to support a
⁴⁶ complete social media service, while clients primarily download data or create data at a much
⁴⁷ smaller scale.

⁴⁸ R packages on CRAN are limited to monthly updates, whereas upstream APIs can change
⁴⁹ frequently, so the package is designed to be robust to changes in the Bluesky Social API. Most,
⁵⁰ if not all, processing of data is optional, with an explicit opt-out via the clean argument. For
⁵¹ the remainder, columns are processed based on their length and type. This avoids hard-coding
⁵² any specific names or types that may change in the future. Of course, these can still break if
⁵³ a column's meaning is changed upstream, though such changes have been rare. This choice
⁵⁴ requires careful, manual updates any time the upstream API changes meaningfully, but will
⁵⁵ automatically work for any minor updates.

⁵⁶ State of the field

⁵⁷ When development started, bskyr was the only R package available for interacting with Bluesky
⁵⁸ Social. It has grown to be the most downloaded R package for using Bluesky Social. atrrr
⁵⁹ ([Gruber et al., 2025](#)), another R package, provides similar functionality for the primary posting
⁶⁰ and data collection features and is built with automatic parsing of Bluesky's lexicons. However,
⁶¹ it only exports functions for a smaller set of endpoints than those supported by bskyr.

⁶² Programmatic access to the Bluesky Social API is available in several other languages. Notably,
⁶³ Bluesky Social provides its own official Typescript package and python has a popular AT
⁶⁴ Protocol SDK ([Siamionau, 2025](#)). Given the absence of any R alternatives at the beginning of
⁶⁵ development, bskyr was started to provide R users direct access to Bluesky Social. Additionally,
⁶⁶ studies of social media platforms are frequent in social science research, where the R language
⁶⁷ is most common. Further, developing an R package, rather than using packages from other
⁶⁸ languages, allows the use of tidyverse-style data frames with nested columns, which simplify
⁶⁹ this type of data analysis workflow in R.

⁷⁰ Research impact statement

⁷¹ Bluesky Social is a relatively new social media platform, but has already seen significant
⁷² adoption. Due to the decentralized design, researchers can use bskyr in support of a wide
⁷³ range of social media research, from running experiments to collecting data for observational
⁷⁴ studies.

⁷⁵ bskyr is available on CRAN and has been downloaded at least 20,000 times since its release.
⁷⁶ Every function is fully documented and contains examples of function-by-function use. The
⁷⁷ package contains 3 vignettes which provide long-form examples of how to use the package.

⁷⁸ The package itself is available under the MIT license. All development occurs on GitHub,
⁷⁹ where users can find latest releases, report issues, and contribute to the codebase. Tests are
⁸⁰ run after every commit on GitHub Actions and nightly on CRAN via testthat ([Wickham, 2011](#)).

⁸¹ Examples

⁸² At its simplest, bskyr formats data inputted by users into lists that can be passed to the
⁸³ Bluesky Social API. It also automates conversion from JSON to an R tibble when users want
⁸⁴ to read content from Bluesky. Below demonstrates the simplest workflow for authenticating,
⁸⁵ making a simple post, and then gathering data from a single endpoint.

86 Prior to making or collecting content, users must authenticate with Bluesky. To authenticate,
 87 all users need an account with a handle and an app password.

```
library(bskyr)
bs_auth(user = 'chriskenny.bsky.social', app_password = 'XXXX-XXXX-XXXX-XXX')
```

88 From there, users can utilize many of the functions in bsky to interact with Bluesky Social.
 89 For example, users can post content to Bluesky Social using the bs_post function:

```
bs_post('Hello, Bluesky!')
```

90 Users can retrieve nearly all records from Bluesky Social. For example, users can get information
 91 on a specific user using the bs_get_user function:

```
bs_get_user('chriskenny.bsky.social')
```

92 AI usage disclosure

93 No generative AI tools were used in the development of the software or writing of this
 94 manuscript. ChatGPT 4o was used in a limited capacity to improve the coverage of the R
 95 package vignettes and all suggestions were manually reviewed.
