7 Summary

8 Data assimilation (DA) is an essential procedure in Earth and environmental sciences, enabling
9 physical model states to be constrained using observational data.

10 In the DA process, observations are integrated into the physical model through the application
11 of a Measurement Operator (MO) – a connection model mapping physical model states to
12 observations. Researchers have observed that employing a Machine-Learning (ML) model as a
13 surrogate MO can bypass the limitations associated with using an overly simplified MO ([B. A.](#)
14 [Forman & Xue, 2017](#); [B. Forman & Reichle, 2014](#); [Xue & Forman, 2015](#)).

15 Statement of Need

16 A surrogate MO, as a ML model is trained with the assumption that a single MO applies when
17 mapping physical model states to observations. When dealing with a large spatio-temporal
18 scale, multiple mapping processes may exist, prompting consideration for training separate
19 MOs for distinct spatial and/or temporal partitions of the dataset. As the number of partitions
20 increases, a challenge arises in distributing these training tasks effectively among the partitions.

21 To address this challenge, we developed a novel approach for distributed training of MOs. We
22 present the open Python library MOTrainer, which to the best of our knowledge, is the first
23 Python library catering to researchers requiring training independent MOs across extensive
24 spatio-temporal coverage in a distributed manner. MOTrainer leverages Xarray's ([Hoyer &](#)
25 [Joseph, 2017](#)) support for multi-dimensional datasets to accommodate spatio-temporal features
26 of input/output data of the training tasks. It provides user-friendly functionalities implemented
27 with the Dask ([Rocklin, 2015](#)) library, facilitating the partitioning of large spatio-temporal
28 data for independent model training tasks. Additionally, it streamlines the train-test data split
29 based on customized spatio-temporal coordinates. The Jackknife method ([McCuen, 1998](#)) is
30 implemented as an external Cross-Validation (CV) method for Deep Neural Network (DNN)
31 training, with support for Dask parallelization. This feature enables the scaling of training
32 tasks across various computational infrastructures.

33 MOTrainer has been employed in a study of vegetation water dynamics ([Shan et al., 2022](#)), where
34 it facilitated the mapping of Land-Scape Model (LSM) states to satellite radar observations.

35 Tutorial

36 The MOTrainer package includes comprehensive [usage examples](#), as well as tutorials for:

- 37 1. Converting input data to Xarray Dataset format: [Example 1](#) and [Example 2](#);
- 38 2. Training tasks on simpler ML models using sklearn and daskml: [Example Notebook](#);
- 39 3. Training tasks on Deep Neural Networks (DNN) using TensorFlow: [Example Notebook](#).

40 Acknowledgements

41 The authors express sincere gratitude to the Dutch Research Council (Nederlandse Organ-
42 isatie voor Wetenschappelijk Onderzoek, NWO) and the Netherlands Space Office for their
43 generous funding of the MOTrainer development through the User Support Programme Space
44 Research (GO) call, grant ALWGO.2018.036. Special thanks to SURF for providing valuable
45 computational resources for MOTrainer testing via the grant EINF-339.

46 We would also like to thanks Dr. Francesco Nattino, Dr. Yifat Dzigan, Dr. Paco López-Dekker,
47 and Tina Nikaein for the insightful discussions, which are important contributions to this work.
